目录

- 词法分析
- 文法分析：从顶向下的分析方法
- 生成字节码
- 虚拟机执行

词法分析的基本结构

- 一个状态转换图可用于识别(或接受)一定的字符串。

识别整常数的状态转换图

识别标识符的状态转换图

- 例如: DFA $M = (\{0, 1, 2, 3\}, \{a, b\}, f, 0, \{3\})$, 其中: f 定义如下:

$f(0, a) = 1$

$f(0, b) = 2$

$f(1, a) = 3$

$f(1, b) = 2$

$f(2, a) = 1$

$f(2, b) = 3$

$f(3, a) = 3$

$f(3, b) = 3$

	a	b
0	1	2
1	3	2
2	1	3
3	3	3

状态转换矩阵

状态转换图

文法分析

自顶向下的递归下降分析法

- $E \rightarrow T ('+' | '-' T) *$
- $T \rightarrow F ('*' | '/' T) *$
- $F \rightarrow \text{num} | \text{var} | '(' E ')'$
- 基本规则：
 - 非终结符实现为函数
 - 或操作 (|) 实现为 if 语句
 - 包含一个或者多个 (+ *) 实现为 while 语句

思考

- 为什么不能有左递归？
- `stmt -> if_stmt | while_stmt | for_stmt` 如何决定应该使用哪个规则进行推导呢？
- `assign -> var '=' expr`
`call_stmt -> var '(' args ')'`
该如何进行区分呢？

$G(E): E \rightarrow i \mid E+E \mid E-E \mid E * E \mid E/E \mid (E)$

 $T \rightarrow FT'$
 $T' \rightarrow *FT' \mid \varepsilon$
 $F \rightarrow (E) \mid i$

Follow集合的意义

- 假定**S**是文法**G**的开始符号，对于**G**的任何非终结符**A**，我们定义

$$FOLLOW(A) = \{a \mid S \xRightarrow{*} \dots Aa\dots, a \in V_T\}$$

特别是，若 $S \xRightarrow{*} \dots A$ ，则规定
 $\# \in FOLLOW(A)$

$a = b * (-c) + b * (-c)$ 的图表示法

抽象语法树

DAG

抽象语法树对应的代码：

```
T1 := -c
T2 := b * T1
T3 := -c
T4 := b * T3
T5 := T2 + T4
a := T5
```

DAG

DAG对应的代码：

```
T1 := -c
T2 := b * T1
T5 := T2 + T2
a := T5
```
